

AVI

ADAPTIVE VISION INTELLIGENCE

AVI is an advanced system based on a smart camera with edge learning technology that enables high-speed quality inspections directly on the production line.

Thanks to its integrated machine learning, it detects defects and anomalies in real time, ensuring accuracy, efficiency and waste reduction without slowing down production cycles.

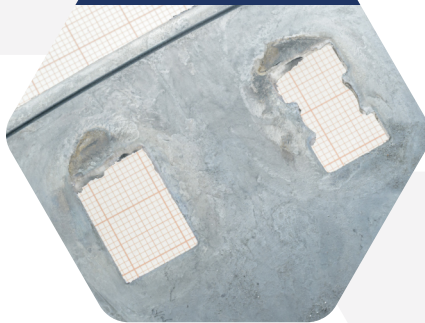

There will no longer be any risk of delivering defective parts to the customer because this system allows them to be detected in time and discarded directly by the robot.

IDENTIFIABLE DEFECTS

Missing thread

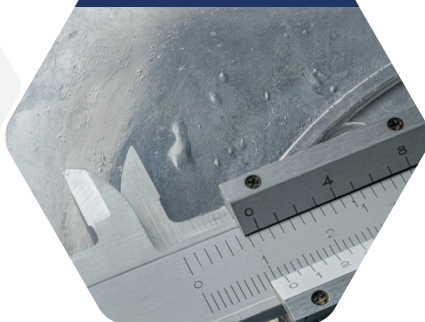

Residual burs

Occluded hole

Aesthetic defects

Incomplete hole
